Present Situation

Mobility and Traffic management based on prohibition aiming at demand management/reduction.

Users/motorists are unhappy with the continuous rise of new constraints to their freedom.

Result is that Mobility is TOO MUCH oriented towards "unsustainable" transport modes

Present Situation

Sustainable transport user's behavior are PENALIZED and DISCOURAGED

- They need more time
- They do their trips in a polluted environment
 - Their costs are higher
 - Their trips are less comfortable
- A sustainable way of life is generally more costly
 - Etc...

NO REAL ADVANTAGE FOR A GOOD BEHAVIOR!!!!!!

New Scenario

Credit-based Mobility

Through Sustainable Mobility behaviors you gain **CREDITS**!!!!!!

For example:

Sustainable Mobility awards (First Price an electric Bike!!!)

Discount on other Sustainable Transport Modes (Public Transport)

Discounts in affiliated Shops or sales networks

. . . .

. . . .

Reduced Taxation!!!!

Sustainable Behavior/Transport Modes

- Public Transport
- Rail
- Park & Ride
- Bicycles
- Car sharing
- Car pooling
- · Bike sharing
- Purchase or use of low emission vehicles (LPG, Gas, Hybrid, Electric Cars)
- Trips made during off-peak hours
- Road Charging Systems
- •
- Purchase or use of Solar panels,
-
- Car free cities or districts

Technologies

- Removable On Board Unit (OBU) on different transport modes
- Personal Identification card
- Ev. GPS
- Communication system
- Gantries
- Infrastructure vehicles communication

Advantages

- Innovative tool for demand management
- Many potential users
- Multi-modal approach
-

Disadvantages

- Mobility should be considered as a whole (complexity)
- · Need of technological improvement and risk of dishonest behavior

CLASSIFICHE INFO

Luca Studer 🔅

Tutti in bici per Bike Challenge Milano!

Chi metterà in sella più amici e colleghi?

La prima Bike Challenge Milano è una competizione divertente e gratuita tra luoghi di lavoro, grandi e piccoli. Vince l'organizzazione in cui la maggior percentuale di persone sale in sella almeno una volta tra il 16 settembre e il 31 ottobre. Iscrizioni aperte per le aziende fino al 25 ottobre.

Fai aderire la tua organizzazione, registrate le vostre pedalate, coinvolgete amici e colleghi a Milano e dintorni, e vincete fantastici premi! In palio anche un viaggio in Nuova Zelanda!

Calculations

CO_2

The statistic for the amount of CO_2 saved by cycling on this website relates to cycle trips that have been logged for transport purposes only. The statistic relates to the total amount of CO_2 released by an average car, illustrating an estimation of the amount of CO_2 saved by cycling instead of driving. It is calculated as follows:

Total units travelled x kg CO_2 per unit = total kg CO_2

This calculation is the total distance of trips logged for transport purposes times the amount of CO_2 released by an average car, which equals the total kilograms of CO_2 per mile.

Defra's carbon conversion factor for an average car (fuel unknown) was used. This is 0.32641kg CO₂ per mile as provided in 'Guidelines to Defra's Greenhouse Gas Conversion Factors for Company Reporting', June 2008.
