Quick Statistics

- 8 Research projects listed, see the [current research list](#).
- 285 Papers and other publications listed in the [database](#).
- 9 Publication collections.
- 223 Unique tags used for classifying publications.
- 1683 Tags used in total.

Team

Below in chronological order our team members. Our team is slowly expanding and we welcome new people! When will you join us!?

- Paul Hoekman** - Recently graduated MPhil Student at the University of Cape Town, South Africa. Initial creator of this website while doing research into the feasibility of undertaking an urban-scale Material Flow Analysis in a South African context. Paul enjoys combining IT and urban metabolism research.
- Aristide Athanassiadis** - Joint-PhD student at the Université Libre de Bruxelles (Brussels, Belgium) and University of Melbourne, Australia. Through different research projects in Brussels and Melbourne, he has been interested in identifying the context-specific factors that influence urban metabolisms using a temporal and spatial perspective.
- Gabriela Fernandez** - Ph.D. candidate in Urban Planning, Design and Policy in the Department of Architecture and Urban Studies at Politecnico di Milano in Milan, Italy. Fernandez is interested in urban metabolism ideologies and is undertaking a material flow analysis of the Metropolitan City of Milan thus identifying urban typologies and socioeconomic indicators in the Italian urban context while promoting urban metabolism public policy.
- Rachel Spiegel** Consulting engineer within energy and environment at Hjeltnes Consult, based in Oslo, Norway. Spiegel is interested in applying systems thinking to our urban and economic structures to integrate environmental and social impacts.
- Joao Meirelles** - Phd student at HERUS / EPFL. Holds a Bsc in Water Resources and Environmental Engineering and a Msc in Complex Systems Modeling and had worked as a Data Scientist at the big data team for the city of Rio de Janeiro. Meirelles is interested in applying big data analysis and complex systems thinking to the urban metabolism.

Google Ngram Viewer Tool: Analyzing and Comparing Urban Metabolism Phrases

Published on Nov 01, 2016

Google Books Ngram Viewer

What is Ngram Viewer?

The Ngram Viewer developed by Google Books displays information through case sensitive phrases over a powerful collection of books, journals and other sources over selected years through varying frequencies. The Ngram Viewer may be used for search to expand their knowledge on phrase usage, wildcard search, inflection and comparison (Advanced Usage). The selection can be utilized in multiple languages (English, Chinese, French, German, Hebrew, Spanish, Russian and Italian) and obtain different results.

How does it work?

The graph allows you to hover over the line plot for an ngram, which highlights it. With a left click on a line plot, you can focus on that particular ngram, greying out the other ngrams in the chart, if any. On subsequent left clicks on other line plots in the chart, multiple ngrams can be focused on. You can double click on any area of the chart to reinstate all the ngrams in the query. The Ngram Viewer raw data is also available for download (Read more about it here).

Analyzing and comparing data

Example 1: Most popular environmental method(s): Life Cycle Assessment, Material Flow Analysis, Energy, Environmental Footprint and Urban Metabolism

The example graph below shows trends in five Ngrams from the 1800 to 2008 by typing "material flow analysis, life cycle assessment, energy, environmental footprint and urban metabolism" (a 5-gram or bigram). The y-axis shows: all of the bigrams contained in Ngram Viewer's sample of books written in English, the percentage of the "selected phrase and incremental/decremental phase. The graph displays the most popular method phrases used between 1800 to 2008 to be "life cycle assessment and energy when compared to environmental footprint, material flow analysis and urban metabolism."

Google Books Ngram Viewer

Graph these comma-separated phrases: Life Cycle Assessment,Material Flow Analysis,Energy,Environment - case-insensitive between 1800 and 2008 from the corpus English with smoothing of 3 Search lots of books

Data Visualizations in Urban Metabolism Research

There are many ways to visualize your results in urban metabolism research. However, it is a challenge to design a map or diagram that is clear and appealing at the same time, and that captures the full extent of your dataset. Should you use sankey diagrams, maps, or other visual representations? What software to use? How to make it look professional without spending a lot of time on it? At the Metabolism of Cities website we want to enlist your help to answer those questions! We are setting up a Stakeholders Initiative and invite everyone to join the discussion. Data Visualizations will be our first topic of discussion, running from October-December 2016. In this period, we will publish blog posts (guest contributions are welcome), host online discussions, take stock of work in this field, and build or expand on open source software that can help develop data visualizations.

Introduction to Data Visualizations

Introduction post on our blog by Aristide Athanassiadis. This post discusses what type of visualizations to use, which software to use, and provides some examples of data visualizations.

Participate!

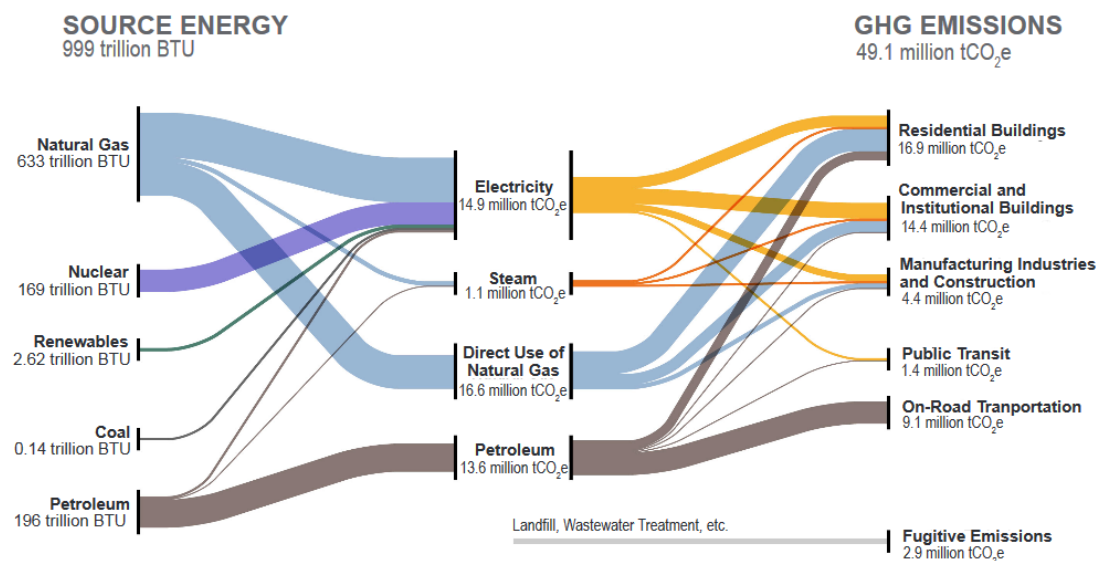

Would you like to participate? Now is the right time to take action! Here is a list of how you can collaborate in this stakeholders initiative:

- **Contribute interesting data visualizations**
We are posting a new data visualization every day, and we would love for you to contribute! Do you have a particularly good, bad, interesting or otherwise captivating data visualization to share? E-mail it to us at info@metabolismofcities.org!
- **Write a guest blog post**
We welcome guest blog posts about any topic related to data visualization. It can be a personal story about how you dealt with data visualizations, or a study of data visualizations in some of the recent work done by authors you admire. Or anything else you feel contributes to this topic. Interested? [Let us know and we can discuss this topic!](#) Contributions are due any time before the year ends.
- **Collaborate in research**
There is an open call to collaborate in a research project around data visualizations. [Read more here](#) and sign up if you are interested in collaborating!
- **Contribute your own idea**

Behind the Scenes of the Global Urban Metabolism Data Extraction

Dataset

The image displays two overlapping Google Sheets spreadsheets. The top spreadsheet, titled 'UrbanMetabolism_LiteratureReview_DATA', contains a table with the following columns: Paper, City, Area, subArea, Year, Year (end), Indicator, Value, Unit, Per capita, and OBS. The data rows list various papers and their associated metrics for London, such as 'Energy and material flows of megacities' and 'Population'. A note in cell J20 states: 'This is the 2006 population figure, which w...'. The bottom spreadsheet, also titled 'UrbanMetabolism_LiteratureReview_DATA', shows a ranking of papers. Its columns are rank, paper, authors, year, region, and DUMPED. The 'DUMPED' column is highlighted in blue, and the rows correspond to the papers listed in the top spreadsheet.

rank	paper	authors	year	region	DUMPED
1	Energy and material flows of megacities	Kennedy, Chris	2016	multiple	
2	Urban Metabolism of Six Asian Cities	Paulo Ferrao a	2014	multiple	
3	Cambio Climático y el Metabolismo Urbano de las Megaurbes Latinoamericanas	Delgado, Gian	2012	multiple	
4	Urban Metabolism of Paris and Its Region	Sabine Barles	2009	Paris	
5	Urbanization and Socioeconomic Metabolism in Taipei	Shu-Li Huang et	2009	Taipei

Creating your own online data visualizations

Published on Dec 09, 2016

Many researchers are familiar with the regular computer tools and desktop programs that are used for everyday tasks: word processors (like Microsoft Word or LibreOffice Writer) and spreadsheet programs (like Microsoft Excel or LibreOffice Calc) are frequently used to produce documents and reports. However, the use of online software can be very helpful when it comes to preparing data visualizations of urban metabolism research. But unlike office tools, the use of specialist online software is rarely taught in schools and it takes some effort to learn how to use them. The good news is that with a little bit of practice and by using the right tools, any urban metabolism researcher can start producing their own online data visualizations. In this blog post, we will introduce three tools and demonstrate how they work and how they can be used.

We selected three different tools: SankeyMATIC, Online Material Flow Analysis Tool (OMAT) and CartoDB. These were chosen because they provide different kinds of data visualization options but they are all highly relevant to urban metabolism research. They can furthermore all be used free of charge, and are easy to learn. For each of them we will describe what they should be used for, what kind of final can be generated from them, and we include a step-by-step tutorial for each of the tools to show you how to get started with them.

SankeyMATIC

What is it?

SankeyMATIC is an online sankey diagram builder. A sankey diagram is a diagram that shows the origin and destination(s) of flows by drawing a set of connected arrows, representing the quantities by varying the width of each line. This kind of diagram is very useful to visually represent the flow of energy through a system or to display the results of a material or substance flows study. This benefit of using such a diagram is that it can convey lots of information in an easy-to-understand format which requires little explanation. If this data is represented in a tabular format, it is often much more difficult to grasp proportions of flows and the relationship between the different flows. These kinds of diagrams may be easy to understand, but they are difficult to design without the right software. With SankeyMATIC it is possible to develop Sankey diagrams in a matter of minutes and with very little

Resilience and Resource Efficiency in Cities (May 2017)

Systems approaches to make cities resource efficient

Local governments are tasked with maintaining and improving overall quality of life for their cities of which economic development, environment, and health are critical aspects. Long seen as a dichotomy, we now have proven and cost efficient solutions that allow us to combine both economic development and health of places and people. A resource efficient approach generates innovation and combines greater productivity with lower operating costs and reduced environmental impacts, while opening up consumer choices for sustainable lifestyles. Resource efficiency reduces overall city consumption while improving quality of life.

It is however, difficult to achieve resource efficiency if city management is compartmentalized. How many cities are there where the water providers do not talk to energy providers? Urban metabolism is one systems approach to city planning, which makes integrated, inter-sectoral, planning possible. Defined as a way of looking at cities and all the resources that flow within their complex networks ("material flows") of interlocked social and physical infrastructure, urban metabolism conceptualizes the city as a living super-organism in which there are continuous flows of inputs and outputs helps in the study of the patterns of movements of matter and energy. It encourages city planners to consider how cities source, process, and use resources in their spatial and socio-economic planning. Through resource flow analysis cities can:

- Develop policies based on quantitative and qualitative knowledge of the flow of key resources (water, waste, energy, materials) taking into consideration its potential impact on food systems and land
- Consider city resource vulnerabilities beyond city boundaries and over time, making a city more resilient
- Use an integrated analysis to identify sectors where costs/waste can be cut down and 'close the loop' towards circular economy.
- Ensure equitable sourcing and distribution of, and access to resources using a resource map layered with socio-economic data

Cities occupy **3%** of land surface

Cities produce **50%** of global waste

Cities account for **60- 80%** of global GHG emissions

Cities consume **75%** of natural resources

Cities produce **80%** of global GDP

High potential for savings through Resource Efficiency

30%

Water savings globally through minor investment and behavioral change

30% to 50%

Energy savings potential in existing buildings through behavioral change and application of readily available and low-cost technologies.

USD 41 TRILLIONS IN SAVINGS

Investment required for urban infrastructure in the next 20 years: Greater resource efficiency - in water, waste, transport and energy- could generate significant savings by reducing infrastructure needs and operating costs.

What is the Global Initiative for Resource Efficient Cities?

The Global Initiative for Resource Efficient Cities (GI-REC) is a cooperation platform offered by UN Environment to connect many different institutions that are using systems approaches (specifically urban metabolism and morphology approaches) towards building low-carbon, resilient, and resource efficient cities. Using UN Environment's convening ability, the Initiative distinguishes itself from other city sustainability activities by (a) building on existing city networks, and (b) having a sustainable consumption and production entry point to assist cities with realizing the economic, social and environmental benefits of resource efficiency.

Tools and Support Mechanisms

Creating Knowledge (developing tools and research products)

In various fields related to resource efficiency and SCP as well as to increase access, processing and use of resources through supply chain and life cycle management, to facilitate decision-making in creating solutions to improve efficiency of processes and use of resources within and across value chains, taking a Life-Cycle approach.

Piloting

To help cities apply the Urban Metabolism approach:

- Access to methodology and technical expertise.
- Intra-city decision-making processes based on science, translating theory into practice.

Network Platform

It provides a mechanism for decision makers to exchange experiences, share best practices, and establish a peer-review process across cities for further improving access to resources and their efficient use.

Resilience and Resource Efficiency *in Cities*
